

Xeriscape is environmental or landscape design that uses various methods for minimizing the need for water use. One method to minimize water use in landscaping is to use plants with low water needs. These plants may be unfamiliar to most people. Benton Conservation District joined Washington State Extension and other community partners to develop a local xeriscape demonstration garden. We featured plants that thrive in our climate and have low water needs. Visit the xeriscape garden in front of the WSU Extension office at 5600 W. Canal Drive, Kennewick.
